

The investment value of flywheel energy storage

Are flywheel energy storage systems economically feasible?

Equipment cost distribution for the flywheel energy storage systems. FESSs are used for short-duration power applications. Therefore, power capital cost (\$/kW) could be a useful parameter to compare the economic feasibility of energy storage systems for similar power applications.

How can flywheels be more competitive to batteries?

The use of new materials and compact designs will increase the specific energy and energy density to make flywheels more competitive to batteries. Other opportunities are new applications in energy harvest, hybrid energy systems, and flywheel's secondary functionality apart from energy storage.

What is the power rating of a flywheel energy storage system?

Utility-scale energy storage systems for stationary applications typically have power ratings of 1 MW or more. The largest flywheel energy storage is in New York, USA by Beacon Power with a power rating of 20 MW and 15 min discharge duration.

What are the applications of Flywheel energy storage?

The distributed energy generation segment is another lucrative application of flywheel energy storage, as it is known for providing faster power backup. The areas prone to natural disasters majorly install distributed energy generation so that such areas can access electricity during natural disasters.

Are flywheel energy storage systems a good alternative to electro-chemical batteries?

Electro-chemical ESSs can be used in short-duration services, but they suffer from a short lifetime and the need to dispose of toxic materials. Flywheel energy storage systems (FESSs) are a promising alternative to electro-chemical batteries for short-duration support to the grid.

What is the largest flywheel energy storage?

The largest flywheel energy storage is in New York, USA by Beacon Power with a power rating of 20 MW and 15 min discharge duration. Utility-scale flywheel storage is typically used for frequency regulation to maintain grid frequency by matching electricity supply and demand for a short period, usually 15 min.
