

# The necessity of new energy storage

Do energy storage systems ensure a safe and stable energy supply?

As a consequence, to guarantee a safe and stable energy supply, faster and larger energy availability in the system is needed. This survey paper aims at providing an overview of the role of energy storage systems (ESS) to ensure the energy supply in future energy grids.

Why do we need energy storage systems?

This capability is essential for maintaining grid stability and ensuring a consistent energy supply, even when renewable generation is low. As the CFR states, the deployment of energy storage systems is crucial for achieving a green energy transition and meeting global climate targets.

Why do we need a co-optimized energy storage system?

The need to co-optimize storage with other elements of the electricity system, coupled with uncertain climate change impacts on demand and supply, necessitate advances in analytical tools to reliably and efficiently plan, operate, and regulate power systems of the future.

Why is energy storage important in the energy transition?

As renewable energy sources gain prominence, energy storage becomes crucial for their integration and optimization. The paper explores various types of energy storage systems and their role in the energy transition, highlighting benefits such as renewable integration, grid stability and cost reduction.

What is the future of energy storage?

Storage enables electricity systems to remain in balance despite variations in wind and solar availability, allowing for cost-effective deep decarbonization while maintaining reliability. The Future of Energy Storage report is an essential analysis of this key component in decarbonizing our energy infrastructure and combating climate change.

Should energy storage be a solution?

Energy storage offers a solution. Capturing and storing excess renewable energy when it is plentiful and releasing it as needed could solve both problems. On sunny and windy days, renewable energy sources can supply energy storage systems, which can be deployed at night, on cloudy days, or when there's less wind.
